Your first steps into IBM Quantum Computing

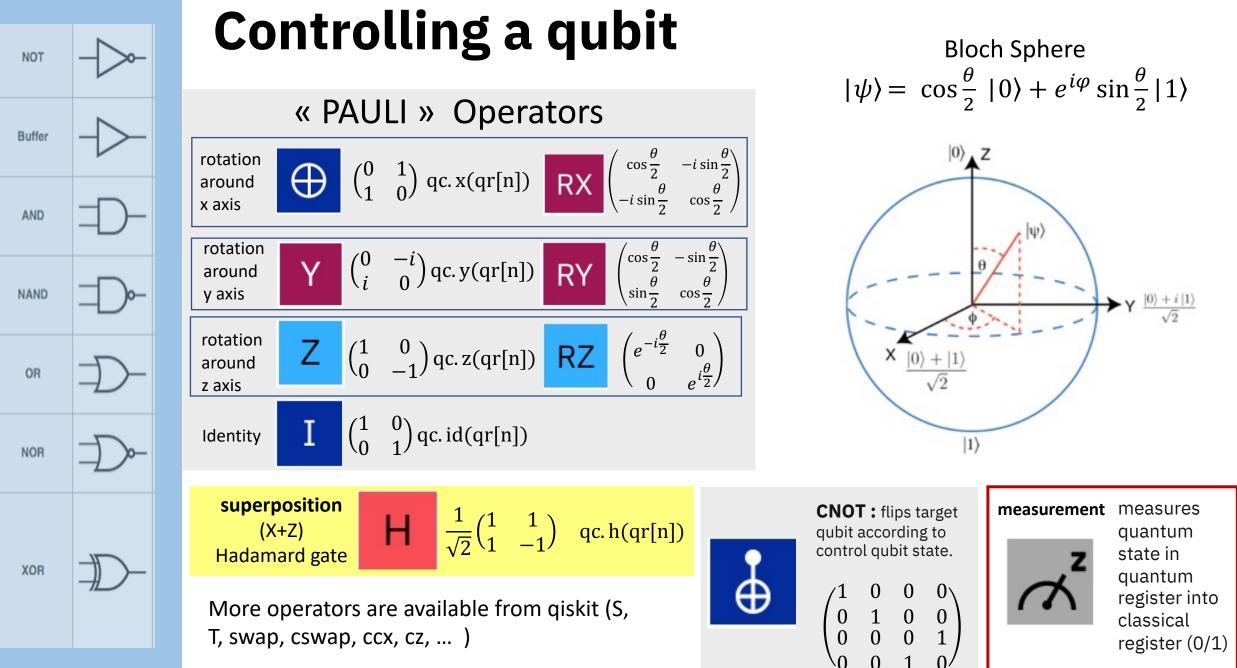

IBM Client Center Montpellier Jean-Michel Torres | <u>torresjm@fr.ibm.com</u> Nov 16nd 2021

Part 1

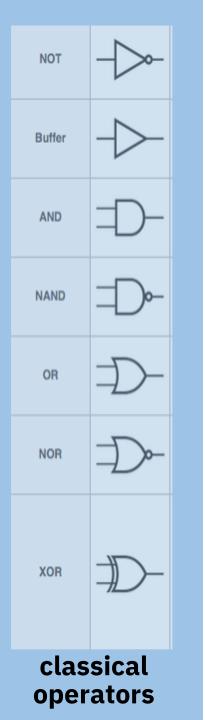

Guided tour of the IBM Quantum devices,

and Quantum « Hello World! »

© 2021 IBM Corporation

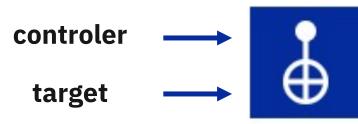

quantum operators :

H operator (Hadamard)

$$|\mathbf{0}\rangle - \mathbf{H} \rightarrow \frac{1}{\sqrt{2}}(|\mathbf{0}\rangle + |\mathbf{1}\rangle)$$

creates equal superposition of states $|0\rangle$ and $|1\rangle$

Control-Not operation

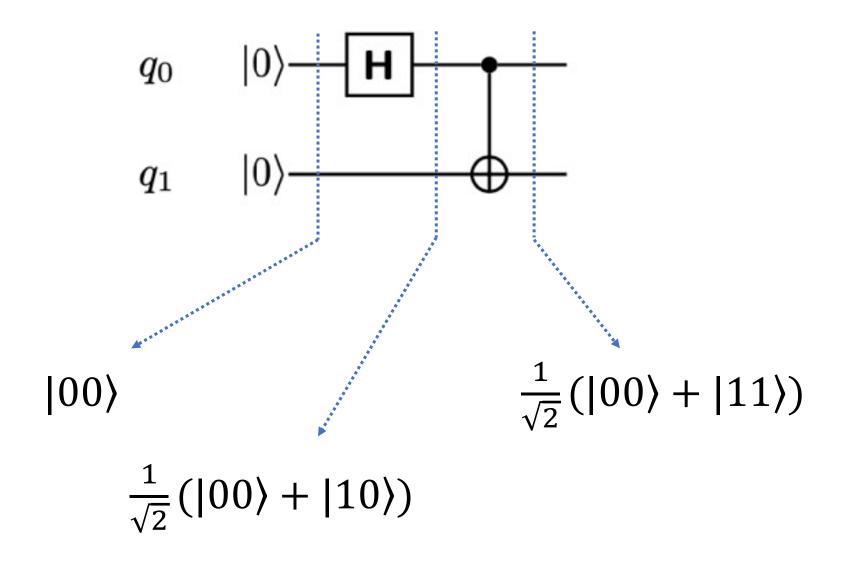

target qubit state is flipped if and only if the control qubit is in state **|1**>

creates quantum entanglement of two qubits

Hello World!

Hello World! example

Hadamard gate applied to q_0 , then Control-Not applied to q_1 , controlled by q_0

This produces the « Bell-State »

With words :

System starts in $|00\rangle$ (both q_0 and q_1 in state $|0\rangle$).

Then q_0 goes through Hadamard and gets into equal superposition of $|0\rangle$ and $|1\rangle$.

After q_0 controls q_1 , the state of q_1 is in a superposition of $|0\rangle \& |1\rangle$, $(q_1$ stays at $|0\rangle$ when q_0 is $|0\rangle$, and q_1 goes $|1\rangle$ when q_0 is $|1\rangle$).

So : both q_0 and q_1 are in $|0\rangle$ (state $|00\rangle$) or both q_0 and q_1 are in $|1\rangle$ (state $|11\rangle$). Our system is in equal superposition of $|00\rangle$ and $|11\rangle$.

The two qubits are entangled: if you measure one of the qubits, you immediately know the state of the other.

In between :

System starts in $|00\rangle$, then : H $|00\rangle = \frac{1}{\sqrt{2}}(|00\rangle + |10\rangle)$

Applying CNOT: left part of the sum stays as is, right term goes to $|11\rangle$ resulting state is $\frac{1}{\sqrt{2}}(|00\rangle+|11\rangle)$.

One can easily prove there are no $\alpha, \beta, \gamma, \delta$ such that:

 $(\boldsymbol{\alpha}|0\rangle + \boldsymbol{\beta}|1\rangle) \otimes (\boldsymbol{\gamma}|0\rangle + \boldsymbol{\delta}|1\rangle) = \frac{1}{\sqrt{2}} (|00\rangle + |11\rangle) \qquad \begin{pmatrix} 1 & 0 & 0 & 0\\ 0 & 1 & 0 & 0\\ 0 & 0 & 0 & 1 \end{pmatrix} \times \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\ 0\\ 1\\ 1 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\ 0\\ 0\\ 1 \end{pmatrix}$

So, the resulting state is not the product of two quantum states, instead this is an entangled state.

With maths :

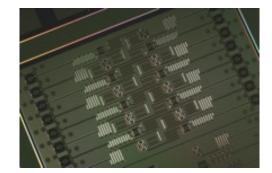

Stage 1 (H on q0) :

```
(H \otimes I) |00\rangle =
\frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 \\ 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 0 \\ 1 \\ 0 \end{pmatrix}
Stage 2: CNOT(0,1)
(1 \quad 0 \quad 0 \quad 0) \quad (1) \quad (1)
```

```
 = \frac{1}{\sqrt{2}} (|00\rangle + |11\rangle)
```

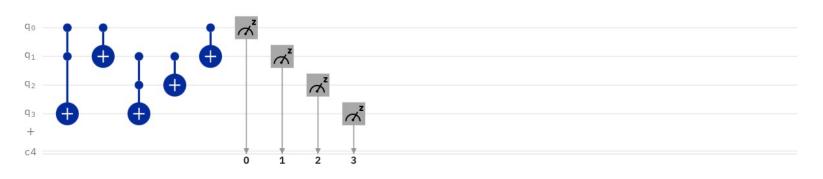

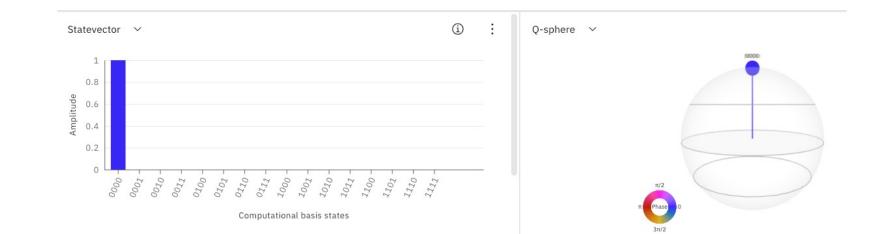

Quantum Circuit
